

KOHLER Enterprise Intelligence Agent

Track 3: Unified Enterprise Conversational AI Agent Prototype —
KOHLER-MITWPU AI Research Lab case study. High-impact executive
summary of a permission-aware copilot for enterprise governance.

The Enterprise Challenge & Strategic Opportunity

Policy Fragmentation

Governance rules scattered across HR, Finance, Support, Data Privacy, and Legal — employees spend hours cross-referencing PDFs for routine decisions.

Compliance Drift

Version confusion (e.g., \$50/day in 2024 vs \$75/day in 2026) causes erroneous filings and audit flags.

Security Risks

Generic chatbots lack deterministic access controls—sensitive policy data can leak if not filtered pre-retrieval.

Opportunity: Deploy a unified agent for cross-domain reasoning, deterministic RBAC filtering, temporal supersession handling, and multi-format outputs (JSON, Excel, Email).

Architectural Innovation & Technical Moat

Empirical Validation & Scenario Performance

Test Coverage

8/8 case study scenarios passed — automated live executions across official scenarios.

Latency

Average execution latency $\approx$ 320 ms (measured in-browser via `performance.now()`).

RBAC Containment

100% deterministic containment — employees receive 0 restricted executive chunks.

Structured Output Validity

100% valid: JSON parses and Excel generates as genuine binary workbook.

Estimated Savings

Prototype estimate: $\sim$ 1.8 hours saved per query compared to manual 5-repository cross-checks (modeled, not empirically measured).

Hallucination Rate

Not measured — requires longitudinal human evaluation; transparently labeled N/A.

Live prototype demos: grounded \$75/day calculation with citations; cross-domain synthesis (Privacy, Legal, Support); deterministic RBAC tests; .xlsx generation; ReAct flows with human approval gates.

Business Impact & Production Roadmap

The KOHLER agent pairs foundation models with deterministic security, temporal reasoning, and human-in-the-loop governance for a production-ready enterprise AI.

Global Rollout

Full ERP and Workday connectors

Enterprise Pilot

Pinecone/Vertex AI search
and Okta SSO

Prototype

In-memory knowledge
base and simulated RBAC

1

Decision Velocity

Replaces 1.5–2 hours of manual policy hunting with sub-second verified answers.

2

Audit & Compliance

Eliminates reliance on superseded policies and provides centralized audit logs of automated lookups.

3

Workflow Automation

Auto-generates audit spreadsheets and procurement emails to reduce manager friction.

❏ Takeaway: A mature vision for enterprise AI — deterministic access, temporal policy reasoning, and artifact synthesis enable secure, auditable, high-value automation.
